Arrhenius acids and bases are a sub-class of Brønsted acids and bases, which are themselves a subclass of Lewis acids and bases. In acid-base chemistry, the hydrogen ion is often called and written as a proton ( $H^+$ ), but in fact it exists in a variety of hydrated forms that include  $H_3O^+$ ,  $H_5O_2^+$ ,  $H_7O_3^+$  and collectively called the ...

Soft Acids and Bases "Soft" acids or bases have a low charge to radius ratio, with low oxidation states. They are normally larger ions that are polarizable. In contrast to the primarily ionic interaction of hard acids and bases, soft acids and bases have a significant covalent bonding component to their interaction.

Some oxides form acids or bases when water is added. Because these compounds don't contain any  $H^+$  or  $OH^-$  ions unless they react with water, they're called "anhydrides." Typically, oxides of nonmetals are acid anhydrides (they form acid when placed in water), and oxides of metals are base anhydrides (forming a base when placed in water).
